

Quantum Logic and Divine Sovereignty

Bridging the gap between the lab and the altar.

”During my study of Physics at KNUST, I was often asked if science made me doubt God. My answer was always the opposite. In Quantum Mechanics, we study ‘superposition’—where a particle exists in multiple states until observed. To the skeptic, this is a paradox; to the believer, it is a glimpse into a universe that is far more mysterious and ‘held together’ than we realize.

If the laws of Thermodynamics demand order, and the laws of Physics demand a First Cause, then science is not a threat to the Gospel—it is a telescope. It allows us to see the intricate, mathematical glory of the Creator. My background in science doesn’t hinder my faith; it provides the logic and rigor I use to study the precision of Scripture.”
